## Examples

### Bio-rad Deep Well Plates

The Bio-rad specs aren't internally consistent: there's a conflict between the well diameters and height vs the well angle.

```
example = Module[{cone, α, rsmall, rbig, hOverall, h},
  α = toRadian[17.5] / 2;
  rsmall = 2.64 / 2;
  rbig = 5.46 / 2;
  hOverall = 14.81;
  h = 14.66; (* from a previous call to Solve *)
  conicalTestTube[cylinder[hOverall - h, rbig], invertedFrustum[h, rbig, rsmall], emptyCylinder[]]
volume @ example
Solve[% == 200, h]

```

```
200.
```

```
{}
```

If we honor the well angle, then the well diameter at opening is too small. Maybe we can't ignore the cap?

```

example = Module[{f},
  f = invertedFrustum[h, rbig, toRadian[17.5] / 2, apexangle];

radius[parts[example]["cylindrical"]] * 2

conicalTestTube[cylinder[14.81 - h, rbig], invertedFrustum[h, rbig, 0.152716, apexangle], cylinder[0, 0]]

```

$$0.0248078 (h - 6.4971 rbig)^3 + (14.81 - h) \pi rbig^2 + 6.80375 rbig^3 = 200$$

$$-0.153915 h + rbig = 1.32$$

## Comparing Bio-rad Plate models

Which should we use?

```

example1 = tubes[bioradPlateWell];
example2 = tubes[bioradPlateWell2];
expr1 = depthFromVolume[example1, v]
expr2 = depthFromVolume[example2, v]
Plot[{expr1, expr2}, {v, 0, volume[example1]}, AxesLabel → {"volume", "depth"}]
Plot[expr1 - expr2, {v, 0, volume[example1]}, AxesLabel → {"volume", "Δdepth"}]

```

```

### Comparing 15mL Falcon Tube models

We should use the fitted one, as we experimentally observed the other model predicting depths that were too large.

```

example2 = tubes[fittedFalcon15ml];
expr1 = depthFromVolume[example1, v]
expr2 = depthFromVolume[example2, v]
Plot[{expr1, expr2}, {v, 0, volume[example1]}, AxesLabel -> {"volume", "depth"}, ImageSize -> Large]
Plot[expr1 - expr2, {v, 0, volume[example1]}, AxesLabel -> {"volume", "Δdepth"}, ImageSize -> Large]
